Prof. Dr. Dierk Niessing  
Institut für Pharmazeutische Biotechnologie  
Universität Ulm  
89081 Ulm

**Re: Akademische:r Beschäftigte:r (m/w/d), Institut für Pharmazeutische Biotechnologie — Ref. 26067**

Dear Professor Niessing,

I am applying for the position of Akademische:r Beschäftigte:r at your institute (Ref. 26067). The role — strengthening bioinformatic analysis of high-throughput datasets and AI tooling, both for research and for the new Pharmaceutical & Molecular Biotechnology Master's programme — aligns closely with both my training and the work I have been doing full-time for several years.

**High-throughput omics bioinformatics.** This is my core. I hold an MSc in Computational Biology (Tübingen), and my work centres on the analysis of transcriptomics, proteomics, and metabolomics data. Lavoisier is a high-throughput mass-spectrometry pipeline for proteomics and metabolomics (98.9% NIST accuracy, >100 GB datasets); Gospel integrates host genotype, transcriptomics, and metagenomics, validated against 1000 Genomes, gnomAD, and UK Biobank. Detecting pathological features in large biological datasets, with modern AI tooling, is exactly the work I do.

**Relevance to the institute's focus.** Your institute studies gene regulation in neuronal disease using high-throughput methods to detect pathological abnormalities. I have built disease-state models in precisely this spirit — including neurodegeneration (Parkinson's and ataxia, from wearable and physiological signal data) and tumour disease state — where the task is to recover a pathological signature from high-dimensional data. I would be glad to bring these methods to your projects.

**Teaching and the new programme.** I am drawn to the chance to help establish the PMB programme, and I bring direct teaching experience to it: during my doctoral research at TUM I taught at the Master's level and supervised student work. Together with the extensive open documentation and tutorial material I have written for every tool I build, and my experience explaining high-throughput analysis to interdisciplinary, non-specialist audiences, this means I can contribute to course design and delivery from the start. I would welcome the opportunity to design and deliver bioinformatics coursework, supervise student projects, and bring my own ideas to a programme being built from the ground up.

**Background and fit.** My MSc in Pharmaceutical Biotechnology (HAW Hamburg) maps directly onto the institute's domain, and I have hands-on wet-lab experience (LC-

MS/MS and MALDI workflows at UKE Hamburg; cell culture and microscopy during my BSc thesis), though I understand this is advantageous rather than required. English is native (C2); I have been resident in Germany since 2011 and am available to begin on 1 August 2026.

I would welcome the opportunity to discuss how my omics-bioinformatics and AI background could support your research and the new Master's programme.

Yours sincerely,

**Kundai Farai Sachikonye**
